

★ Abstraction :

→ Hiding implementation process.

Syntax:-

```
abstract class ClassName {  
    abstract void MethodName();  
    void normalMethod();  
    // code  
}
```

→ abstract method
no body.

* Polymorphism :

↳ it means many forms.

→ same method or operator behaves differently on the object or data.

→ eg: Same person performs different roles.

Types

Compile-time
(method overloading)

↓
same name,
different parameters.
(same class)

Run-time

(method overriding)

↓
same name,
same parameters.
(parent & sub class)
