

Rows $\rightarrow$ records (entity)
columns $\rightarrow$ fields (attributes)

Primary key $\rightarrow$ $\circ$ cannot be null.

Foreign key $\rightarrow$ $\circ$ Unique.
 $\circ$ Link two tables.
 $\circ$ Maintain Relationships.

Chapter - 12

* MySQL:

- $\circ$ The data is stored in tabular format.
- $\circ$ It is in a structured format thus, easy data access.

* DBMS: $\circ$ stores data as files.

RDBMS: $\circ$ uses keys for accessing data and stores data as tables.

entities $\rightarrow$ used for creating relations.
attributes $\rightarrow$ data enclosed.

* Databases:

$\rightarrow$ organised collection used for storing data.

$\rightarrow$ uses JDBC (Java Database Connectivity) for accessing:

$\rightarrow$ store
Retrieve
Update
Delete

$\rightarrow$ It can store data permanently.

* Clauses:

$\circ$ Helps in filtering, altering & sorting data.
