

Chapter - 5

Functions :-

- Block of code (reusable)
- To call these functions we use objects & we need objects to call functions.
- Redundancy → to repeat a same code.
- Also called as a method / behavior. as it performs a specific task.

→ Types :

(i) Predefined	(i) Parameters (with/without)
(ii) Userdefined.	(ii) ReturnType (1st)

- CamelCase Naming : Name of the method (don't use keywords as "method name").

(i) Methods with Parameters : These methods take input values inside parameters (parenthesis) when called.

Syntax :-

```
returnType methodName (type param1, type param2, ...){  
    // statements  
}
```

- * Static method : This method belongs to ~~the~~ ^{the} class rather than an instance (object) of the class.
→ you can call it directly using the class name.
