

* Constructor

- special method to create or initialize objects.
- has the same name as class name "always".
- Doesn't have a return type.
- automatically called when an object is created using "new".

Syntax:

```
= class className {
    // constructor
    className() {
        // initialization code
    }
}
```

* Constructor overloading :

- having multiple constructors in the same class but with diff. number or type of parameters (different initializations)
- also known as compile time polymorphism.
- called using this() keyword.

* Three types of variables :

- Local variable : • declared inside a method, constructor or block. keyword
- Static variable : • declared inside a class with "static".
- Instance variable : • declared inside a class but outside method without "static" keyword.
