

* While loop :

→ it runs as long as the condition is true. also known as top-down cond.

Syntax:

```
while (condition) {  
    // statements  
}
```

Eg:

```
while (i <= 5) {  
    Sys.out.println("Num:" + 1);  
    i++;
```

to print numbers from 1 not 2, that's why i++ is written after system.out.println not before it.

O/p

Num :	1
Num :	2
"	3
"	4
"	5

* Do while loop :

→ at least runs once even if the condition is false.

Syntax:

```
do {  
    // statements  
} while (condition).
```

• also known as bottom-up condition.

Eg:

```
int i = 1  
do {  
    Sys.out.println("Num:" + i)  
    i++;  
} while (i <= 5);  
}
```

* Enhanced for loop:

→ used when the array is shuffled and it can iterate through arrays or collections (n numbers but same d type)
for (dataType variable : arrayName) {
 // statements
}

→ if we are going to perform any kind of operation like add, sub. then initiate "sum = 0".

→ initial value of index starts from "0".

eg: int []arr = {10, 45, 23, 67, 34};
int max = arr[0]; //initializing index value.
for (int num : arr) {
 if (num > max) {
 max = num; } → replaces max's place by the array num.
 }
 Sys.out.println ("Largest element = " + max);
}

* Break statement:

• to exit a loop or switch statement immediately
